Full-Stack on AWS Bootcamp

Participant Prep Checklist (please complete before Day 1)

Please have the following ready before the first session so you can start building from hour one. It takes about 30 minutes.

1. Accounts to have ready

☐ A GitHub account (create one at github.com if you don't have it), and reply with your GitHub username so we can add you.

☐ Accept the GitHub organization invite we email you (this also gives you GitHub Copilot).

☐ AWS access: we provision your AWS account and send credentials. You do NOT need to create your own AWS account. Just keep the credentials we send handy.

2. Tools to install

☐ Git (git-scm.com)

☐ Node.js 18 or later (LTS, from nodejs.org)

☐ Python 3.10 or later (python.org)

☐ AWS CLI v2 (search AWS docs for “Install AWS CLI”)

☐ Terraform (developer.hashicorp.com/terraform/install)

☐ A code editor: VS Code

3. Verify everything works

Open a terminal and run each command below. Each should print a version number, not an error:

```
git --version
node --version
python3 --version
aws --version
terraform -version
```

4. Nice to have (optional warm-up)

☐ Comfort with basic terminal / command-line navigation.

☐ Basic Git: clone, commit, push, and what a pull request is.

☐ A high-level idea of React (frontend), FastAPI (Python backend), and MongoDB (database). We teach these; it just helps to have heard of them.
